## CONFERENCE: IMPURE PERCEPTION

### On Non-Sensory Influence on Sensory Processing

Within philosophy and the cognitive sciences it has been traditionally assumed that perception is “informationally encapsulated”: it was believed that sensory systems could not be influenced by information outside the senses. This view, also known as the “modularity” of perception, has been widely accepted until recently, but some researchers are beginning to challenge the received view. There is evidence that what we see, for example, can be influenced by our emotional states, motor responses, beliefs, and even the language we speak. If so, this has implications for the epistemic authority of perception, the division between mind and body, and the alleged universality of perceptual experience. This conference brings together an international group of researchers who have been at the forefront of this emerging perspective. Psychologists, psycholinguists, and philosophers will explore ways in which perception might be impure.

### PROGRAM

#### Friday, October 23
